No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 19544, Application US/09248796A

Sequence 19544, Application US/09248796A

Patent No. 6747137

GENERAL INFORMATION:
APPLICANT: Keith Weinstock et al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO CANDIDA ALBICAN
TITLE OF INVENTION: NUCLEIC ACID AND THERAPEUTICS
FILE REFERENCE: 107196.132
CURRENT FAPLICATION NUMBER: US/09/248,796A
CURRENT FILING DATE: 1999-02-12
PRIOR PELING DATE: 1998-02-13
PRIOR FILING DATE: 1998-02-13
PRIOR FILING DATE: 1998-08-13
NUMBER OF SEQ ID NOS: 28208

SEQ ID NO 19544

Patent No. 5776725
GENERAL INFORMATION:
APPLICANT: Kindsvogel, Waylne R.
TITLE OF INVENTION: GLUCAGON RECEPTORS
NUMBER OF SEQUENCES: 25
CORRESPONDENCE ADDRESS:
ADDRESSES: SEED AND BERRY
STREET: 6300 COLUMBIA CENTER
REFERENCE/DOCKET NUMBER: 990008.424C1
                                     TELECOMMUNICATION INFORMATION:
TELEPHONE: 206-624-4900
TELEPAX: 206-682-6031
INFORMATION FOR SEQ ID NO: 15:
SEQUENCE CHARACTERISTICS:
LENGTH: 485 amino acids
TYPE: amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

Sequence 74, Application US/09198452A

Patent No. 6559294

GENERAL INFORMATION:

APPLICANT: Griffals, R.

APPLICANT: Griffals, R.

TITLE OF INVENTION: thereof and uses thereof, in particular for the diagnosis, prevering the Perence of Invention and treatment of infection

TITLE OF INVENTION: and treatment of infection

TITLE REPRENCE: 9710-003-999

CURRENT APPLICATION NUMBER: US/09/198,452A

CURRENT PILING DATE: 1998-11-24

NUMBER OF SEQ ID NOS: 6849

SEQ ID NO 74.

LENGTH: 595

A;Title: The complete sequence of the 1,683-kb pSymB megaplasmid from the N2-fixing endc
A;Reference number: A95842; MUID:21396508; PMID:11481431
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        C;Accession: D90153 Fragatanieri, F.; Zivanovic, Y.; Allard, G.; Awayez, M.J.; Chan Kr;She, O.; Sindh, R.K.; Confalanieri, F.; Zivanovic, Y.; Allard, G.; Awayez, M.J.; Chan Jong, I.; Jeffries, A.C.; Kozera, C.J.; Medina, N.; Peng, X.; Thi-Ngoc, H.P.; Redder, arrett, R.A.; Ragan, M.A.; Sensen, C.W.; Van der Oost, J. Sensen, M.A.; Sensen, C.W.; Van der Oost, J. A.; April 2001
A;Description: Sulfolobus solfataricus complete genome.
A)Genetic code: SGC1
C;Superfamily: H+-transporting ATP synthase protein 6
C;Keywords: ATP biosynthesis; hydrolase; membrane-associated complex; mitochondrion;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cobalamin biosynthesis protein G (cbiG) [imported] - Sulfolobus solfataricus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           C;Species: Sulfolobus solfataricus

WEARNESS, ALAXIA, AND TETINITIS PIGMENTOSA (NARP) [WIM:551500].

DISEASE: Defects in WIATPG are a cause of Leber's hereditary optic neuropathy (LHON) [MIM:555000], also known as Leber's optic atrophy. LHON is a maternally inherited disease resulting in acute blindness due to retinal degeneration predominantly in young man. Cardiac conduction defects and neurological defects have also been described.

DISEASE: Defects in MIATPG are a cause of Leigh syndrome (LS) [MIM:256000]. LS is a severe neurological disorder characterized by bilaterally symmetrical necrotic lesions in subcortical brain

114 (1014). The Arpases have 2 components, CF(1) - the catalytic core - and CF(0) - the membrane proton channel. CF(1) has five subunites: alpha(3), beta(3), gamma(1), delta(1), epsilon(1). CF(0) has three main subunites: alpha(3), pamma(1), delta(1), epsilon(1). CF(0) has three main subunites: alpha(3), pamma(1), delta(1), epsilon(1). CF(0) co. SUBCELBULAR LOCATION: Integral membrane protein (By similarity).

1. SIMILARITY: Belongs to the ATPase A chain family. Remain, PAS19486; AAR91237.1; -..

2. SIMILARITY: Belongs to the ATPase A chain family. Remain, PRO0119; ATP-Synt Asub.

2. PRIMTS: PRO0129; ATP-Synt Asub.

3. TIGRFAMS: TIGRO1131; ATP-Synt Gor A; 1.

4. TIGRFAMS: TIGRO1131; ATP-Synt Gor A; 1.

5. TIGRFAMS: TIGRO1131; ATP-Synt Gor A; 1.

5. TIGREAMS: TIGRO1131; ATP-Synt Gor A; 1.

6. TIGRO1131; ATP-Synt Gor A; 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SEQUENCE FROM N.A.

core - and CF(0) - the membrane proton channel. CF(1) has five subunits: alpha(3), peta(3), gamma(1), delta(1), epsilon(1). CF(0) has three main subunits: a, b and c (By similarity).

-i- SUBCELLULAR LOCATION: Integral membrane protein (By similarity).

-i- SIMILARITY: Belongs to the ATPase A chain family.

REMBL, AY495323; AR595301.i-.

-I CATALYTIC ACTIVITY: ATP + H(2)0 + H(+)(In) = ADP + phosphate + H(+)(Out).

-I SUBUNIT: F-type ATPases have 2 components, CF(1) - the catalytic core - and CF(0) - the membrane proton channel. CF(1) has five subunits: alpha (3), peam (1), delta(1), epsilon(1).

-I SUBCELULIAR LOCATION: Integral membrane protein (By similarity).

-I SIMILARITY: Belongs to ATPase A chain family.

RESULT 11

H(+) (OUT).

-1- SUBUNIT: F-type ATPases have 2 components, CF(1) - the catalytic core - and CF(0) - the membrane proton channel. CF(1) has five subunites: alpha(3), beta(3), gamma(1), delta(1), epsilon(1). CF(0) has three main subunits: a, b and c (By similarity).

-1- SUBURELELULAR LOCATION: Integral membrane protein (By similarity).

-1- SIMILARITY: Belongs to the ATPase A chain family. Coble M.D., Just R.S., O'Callaghan J.B., Letmanyi I.H., Peterson C.T., Irwin J.A., Parsons T.J., Island J.B., Deterson C.T., Island and Clearled polyworthisms over the entire mtDNA genome that increase the power of forensic testing in Caucasians."; Int. J. Legal Med. 0:0-0(2004).

-i- FUNCTION: Key component of the proton channel; it may play a direct role in the translocation of protons across the membrane (By similarity). -!- CATALYTIC ACTIVITY: ATP + H(2)O + H(+)(In) = ADP + phosphate + Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi, Mammalia, Eutheria, Primates, Catarrhini, Hominidae, Homo. - FUNCTION: Key component of the proton channel; it may play a

direct role in the translocation of protons across the membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           H(+) (Out).

-!- SUBUNIT: F-type ATPases have 2 components, CF(1) - the catalytic core - and CF(0) - the membrane proton channel. CF(1) has five subunits: alpha(3), beta(3), gamma(1), delta(1), epsilon(1). CF(0) has three main subunits: a, b and c (By similarity).
-!- SUBCELLULAR LOCATION: Integral membrane protein (By similarity).
-!- SIMILARITY:
increase the power of forensic testing in Caucasians.";

i Patent No. 6551795

i GENERAL INFORMATION:

i APPLICANTY MARCA J. Rubenfield et al.

ITILE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

ITILE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

ITILE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

ITILE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT FILING DATE: 1999-02-18

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 25179

LENGTH: 210

TYPE: PRT

CORGANISM: Pseudomonas aeruginosa

Frong National States of the reaction of phosphodiester charges between 5. Phosphoryl and 3. Pydroxyl groups in double-reaction. This protein catalyzes the formation of phosphodiester charges between 5. Phosphoryl and 3. Pydroxyl groups in double-stranded DNA using NAD as a coenzyme and as the energy source for the reaction. It is essential for DNA replication and repair of demonstration of the subject of the reaction. It is essential for DNA replication and repair of demoxyribonucleotide (N) + (deoxyribonucleotide) (N) = AMP + nicotinamide nucleotide + (deoxyribonucleotide) (N) = (deoxyrib
